

Our ground breaking thought: Don't break up the ground.

It's simple really. Cultivation and growth only happens in the top six inches. So why deep cultivate and mix in weeds, seeds and volunteers, lose valuable moisture and nutrients, waste fuel and man hours making unnecessary passes?

The Claydon System involves one quick pass with our straw harrow to help control weeds and slugs. Then drill with our patented tine strip-till technology, creating the optimum sowing and growing conditions (our drills follow contours, but also level ruts). Finally, consolidate the soil with our rolls. You'll soon find it's your yield records that you're breaking.
